The **Edbak ERM100 electric flat screen wall mount for recessed installations**, says the maker, provides the safest service access system ever. Frameless monitors are very sensitive to touch so their mounting benefits from a specific feature: a pop-out system saves the need to touch the screen-- and thereby avoids any potential for damage.

Edbak designed its pop-out guide system, the most critical structural component of the wall mount, to be robust when engaging and disengaging the flat screen display from the wall recess.

This makes servicing very convenient, reducing time and improving safety. The independent 8-step alignment system helps install (without any special tools) the flat screen monitor flush with the wall surface.

The universal open-work structure and the integrated cable management system allow easy installation and a neater finish of the complete LED video wall.

The seamless carrier frame, by design, is very robust, providing a strong attachment point to the wall substrate. An arrangement of round holes and slots covers all monitor fastener arrangements, while the cross marker system helps in precision planning of the whole LED

video wall layout, to speed the assembly and installation process.

All structural components have been designed and manufactured by the Edbak production facility in Poland, according to all applicable European standards.
