At ISE 2016, Cabletime will unveil two important additions to its range of **MediaStar** solutions. These will include the next generation
MediaStar platform of LAN-Caster Gateways and Encoders
, and the now available
MediaStar 782 media player
, which delivers 4K screen resolution and rich HTML 5 support as well as full multizone digital signage capabilities.

Cabletime is also planning to display and demonstrate its full range of video distribution, media management and signage solutions.

Making its debut at ISE, the **MediaStar LAN-Caster Gateway** is a new platform which promises to provide a step change in the number of channels that can be distributed simultaneously. Users will benefit from the delivery of secure, scalable content from multiple tuners simultaneously from a single gateway. In addition, the new gateway platform, together with the Mediastar range of media players including the new 782, will support content encrypted from end to end.

A rolling programme of demonstrations will highlight the enhancements available from the **MediaStar 782 media player**, which will be on general release at the show. This solution indicates Cabletime’s intention to fully support the digital signage requirements of its customers, providing support not just for single, but multizone signage environments. It also delivers 4K screen resolution support and HTML 5 support and will enable users to incorporate advanced web pages and rich media in their signage designs.

Cabletime will be announcing further product enhancements before the event.

The MediaStar range provides TV/AV and multimedia distribution products primarily for medium to large enterprises, which require future-proof, stable and proven solutions for live TV, corporate communications, multicasts, music TV, training and digital signage.
