

A software upgrade to ClearOne's **VIEW Pro** solution makes it easier to configure AV over IP streaming platforms for full power of any enterprise digital signage system.

ClearOne built the solution to configure streams, signal routing across a large installation and assign IP addresses. It also comes with a web-based GUI, so installers can manage the system from a web browser. Users can also purchase optional software licenses for video walls, video composition and local playback with the solution.

"The ClearOne View Pro solution is the key to unleashing the full power of any digital signage system," says Lewis Eig, ClearOne sales director of network video and audio distribution. "In fact, View Pro delivers the highest quality multimedia streaming on any existing IP network and our new software upgrade makes it easier than ever to configure a system design that enables users to experience the ultimate in 4:4:4, true-color media distribution that is unmatched in scalability and ease of deployment."

A convenient web-based GUI is now available for installers to access from a web browser. Also, the configuration tools on **CONSOLE** software have been organized and redesigned for intuitive and simplified set-ups.
