

Software company **dimedis** releases **kompas 7.0**, the latest version of its digital signage software. More than 4500 players in Germany alone are controlled by kompas.

The highlight of kompas 7.0 is its completely revamped access rights management: kompas administrators can create groups, assign roles and grant users specific permissions such as for certain locations or types of content.

kompas 7.0 enables customers to fine-tune user access rights to their individual needs. Another new feature is the ability to conduct bulk operations on displays and PCs, such as changing the business hours for all locations with a single click. And with kompas 7.0, dimedis is introducing a fresh design for its multi-award-winning software.

Patrick Schröder, Division Manager Digital Signage at dimedis, says, "...we are embracing web technologies, with HTML5 still representing the gold standard for us. What sets us apart is the ease with which interactive content can be embedded into kompas – things like touchscreens or entire kiosk systems, integration with smartphones, remote controls or keyboards. And I am especially glad to be able to present our customers not only with a wealth of new functionality, but also with a fresh look and feel for our software."

Dimedis: Kompas Releases Version 7.0
