Edge-blending has been a luxury effect that comes with larger, more costly event projectors. Now ViewSonic offers an affordable solution allowing for medium-sized events and average users to enjoy widescreen projection and special image effects.

The **ViewSonic EB series** is a standalone processor implementing up/down scaling, format conversion, video walls, 3D decoding, curved surface display, sophisticated image edge blending, and geometric adjustment up to WQXGA input and WUXGA (full HD) output.

The EB series requires no PC for installation and operation... just connect the HDMI cable from the content player and projectors to set up the screen effect and projector position. Content players are also easily replaced for maximum flexibility.

The EB series is equipped with a robust ID design that supports a pro installation condition and environment. Control can be executed through front panel keypads or an IR remote controller. The RS232 can also be used to turn the projector on and off without a PC.

ViewSonic EB series will be available from mid June 2012.
