f

The **Christie TVC-1700** is a built-to-order video wall processor for control room installations that supports video wall configurations with up to 64 outputs and hundreds of inputs.

The TVC-1700 is managed by **Christie MASTERSuite software**, which Christie says enables instant access to any source of visual information in the control room and makes a tiled video-wall display perform as if it were a single, ultra-high resolution Windows desktop -- like a giant video canvas.

Christie TVC-1700 controllers ship with Windows 7 Ultimate so you can run multiple software applications on your video wall directly from the controller.
