Casio's Dual Projection System combines two of Casio's 3000-lumen LED projectors to make a spec'd 6000-lumen system. It's designed so you can use two less expensive Casio projectors instead of a high-brightness projector -- it's **Casio's answer to making LED-lit projectors bright enough for high-light ambient conditions**.

The system is set to automatically geometrically correct and align the two projectors in the mount-based housing. Dubbed the XJ-SK600, the system will debut at the Digital Signage Expo.

Even though this is more of an entertainment-venue projection system - as it's being released out of the new Casio Digital Signage Group.
