ShowKube's **Kshow** is a video processing system for projection that integrates a live mixer, a timeline and a 4K media server into one package.

Kshow features a Linux-based 4U rack-mountable processor and all the workflows needed to prepare a show using its show driver, screen and layout editors and a flexible timeline.

Kshow makes it easy to adjust media for optimal projection on a diverse selection of screen shapes using edge blending and geometric corrections such as keystone, warping and mapping. It also features advanced live video source mixing with real time effects and transformations.

ShowKube offers online tools for content sharing and project backup on the cloud, for decentralized project teams.
