projectiondesign's ProNet.precision automatic projector alignment software claims to **speed up alignment of multichannel projection systems**
such as those used in collaboration, command center and visualization rooms. The system uses sophisticated computing processing and digital camera capture to calibrate and align projectors according to surrounding architecture.

The ProNet.precision application is part of projectiondesign's ProNet software ecosystem, which integrates with the projectiondesign series of projectors and image processors, with building blocks for planning and design, installation and execution, as well as use and monitoring. The system offers remote control over the Internet or local control.
