SpinetiX Integrates CMS in Media Players

Written by Bob Snyder

Called **Fusion**, SpinetiX's new digital signage software application, designed for small-scale signage projects, is a DS design and CMS application.

Integrated within every SpinetiX HMP Hyper Media Player, Fusion allows content to be managed via a web browser interface and can therefore be accessed either locally or remotely using a PC, Mac, Linux or iPad platform -- or any combination of these. Once connection to the player has been achieved, content can be uploaded, edited and published quickly with minimal technical skill.

Because Fusion is installed within every HMP and no additional software is required, there are no subscription license fees for users to pay. The user interface features a pretty intuitive drag-and-drop architecture and there is a choice of languages. There's a demo video to watch as well as info to be found on the link below.
