The double-sided information totem by **MOStron Elektronik GmbH** wins a Red Dot award, the international distinction for high design quality. Participants (57 nations) competed against about 5200 products and innovations for this Red Dot Award: Product Design 2016.

The double-sided information totem comes in a puristic, straight design. The elegance of the totem is emphasized by a sober 104 mm deep case of black anodized aluminum in combination with high quality front glass.

Two full HD displays with a screen size of 55“ each can be operated separately or parallelly. Optionally the totem can be equipped with a PCT-Touch (behind glass) on one or both sides. The displays are protected by a rugged anti-glare safety glass.

Premium-quality material is used, as well as energy saving LED technology and energy-saving industrial computers. The case is rugged and well suited for public use – easy to clean because of its almost seamless front. The totem is available with a stable foot or with a base plate which can be screwed into the floor.

This double-sided totem is part of a larger digital signage family with displays ranging from 10“

to 65", single- and double-sided totems. It can be used as an electronic poster, guidance system in hotels or conference centres, double-sided information system in shopping malls, etc.

For the past 35 years MOStron has been active in the field of embedded systems, industrial and touch solutions, HMI displays, Panel-PCs and electronic displays.

Most of their products originate from their own construction and designs, and that guarantees a uniform appearance of all units.
